

The Standard TLA⁺ Arithmetic Modules

Mathematicians often use $+$ to mean something other than addition of numbers. For example, $+$ is generally used to denote the group operation of an arbitrary Abelian group. To allow you to use such mathematical notation in your specs, operators like $+$ are not built into TLA⁺; they must be declared or defined. You will almost always want them to have their usual meanings.

There are three standard TLA⁺ modules that define ordinary arithmetic operators. You will most often want to import the *Integers* module. [Section 13.1](#)  describes all the operators that these modules define.
