

Answer

There exists a function f satisfying the formula

$$f = [n \in \text{Int} \mapsto \text{IF } n = 0 \text{ THEN } 1 \text{ ELSE } n * f[n - 1]]$$

For example, it is satisfied by the function

$$[n \in \text{Int} \mapsto \text{IF } n \in \text{Nat} \text{ THEN } \text{FactorialOp}(n) \text{ ELSE } 0]$$

Hence, IntFact is a function that satisfies this formula, so $\text{IntFact}[-3]$ equals $(-3) * \text{IntFact}[-4]$. However, $-3 * \text{IntFact}[-4]$ equals $-(3 * \text{IntFact}[-4])$ (by the operator precedence rules of TLA^+). Since we don't know if $\text{IntFact}[-4]$ is a number, we don't know if $(-3) * \text{IntFact}[-4]$ equals $-(3 * \text{IntFact}[-4])$. So, we don't know if $\text{IntFact}[-3]$ equals $-3 * \text{IntFact}[-4]$.
