The Cursor versus the Mouse Pointer

Do not confuse the cursor with the mouse pointer. The cursor marks the position where text that you type is entered into the module. You can move it by left-clicking on the mouse or with certain keyboard commands—for example, by hitting an arrow key. The mouse pointer is what moves when you move the mouse around.

What the Toolbox's prover commands prove and where the Toolbox's comment-making commands make the comments depends on the cursor, not the mouse pointer. This can be confusing if you issue those commands from the menu raised by right-clicking the mouse instead of from the keyboard.
